

Persistent Data Structures (Version Control)

Planar Point Location

$O(n \cdot \log n)$ preprocessing, $O(\log n)$ query

Path copying (trees)

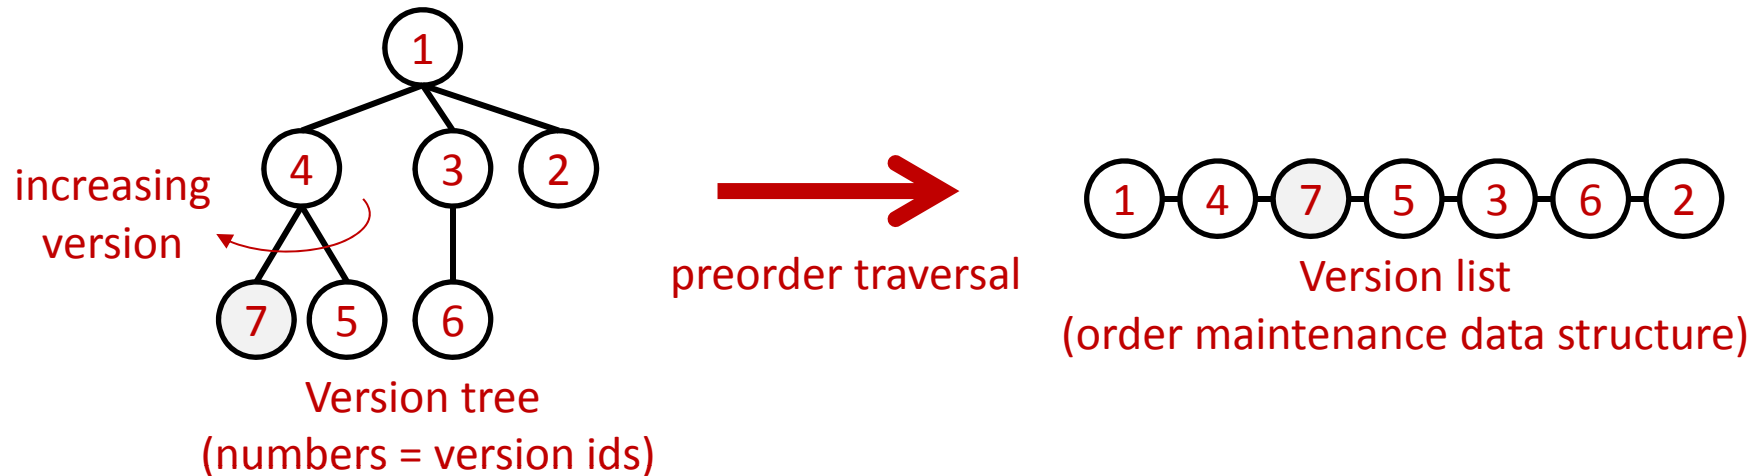

Partial persistence

- Version ID = time = 0,1,2,...
- Fast node (any data structure)**
 - record all updates in node (version,value) pairs
 - field updates $O(1)$
 - field queries \equiv predecessor wrt version id (search tree/vEB)
- Node copying ($O(1)$ degree data structures)**
 - Persistent node = collection of nodes, each valid for an interval of versions, with Δ extra updates, $\Delta = \max$ indegree
 - pointers must have subinterval of the node pointing to; otherwise copy and insert pointers (cascading copying)
 - NB: Needs to keep track of back-pointers

field₁: (0,x) (3,y) (7,z)
 field₂: (0,a) (14,c) (16,b)

| [0,8[| [8,13[| [13,∞[|
|----------------------------------|-----------------------------------|------------------------------------|
| field ₁ : (0,x) (3,y) | field ₁ : (8,z) (10,w) | field ₁ : (13,w) (q5,y) |
| field ₂ : (0,a) (7,c) | field ₂ : (8,c) (9,d) | field ₂ : (13,e) (14,c) |

Full persistence

■ Fat node

- Updates (1,x) (6,y) (7,z) to a field
- Queries = binary search among versions
- Update (7,z): Insert 7 as leftmost child of 4; insert pairs for 7 and 5=succ(7)

field: (1,x) (7,z) (5,x) (6,y) (2,x)

■ Node splitting ($\geq 2\Delta$ ekstra fields)

Persistence techniques

[N. Sarnak, R.E. Tarjan, *Planar point location using persistent search trees*, Communications of the ACM, 29(7), 669-679, 1986]

- Partial persistence, trees, $O(1)$ access, amortized $O(1)$ update

[J.R. Driscoll, N. Sarnak, D.D. Sleator, R.E. Tarjan, *Making Data Structures Persistent*, Journal of Computer and System Sciences, 38(1), 86-124, 1989]

- Partial & full persistence, $O(1)$ degree data structures, $O(1)$ access, amortized $O(1)$ update

[P.F. Dietz, R. Raman, *Persistence, Amortization and Randomization*. Proceedings 2nd Annual ACM-SIAM Symposium on Discrete Algorithms, 78-88, 1991]

[G.S. Brodal, *Partially Persistent Data Structures of Bounded Degree with Constant Update Time*, Nordic Journal of Computing, volume 3(3), pages 238-255, 1996]

- Partial persistence, $O(1)$ degree data structures, $O(1)$ access & updates update

[P.F. Dietz, *Fully Persistent Arrays*. Proceedings 1st Workshop on Algorithms and Data Structures, LNCS 382, 67-74, 1989]

- Full persistence, RAM structures, $O(\log \log n)$ access, $O(\log \log n)$ amortized expected updates

Comparison of persistence techniques

- Copy data structure for each version
 - no query overhead, slow updates & wastes a lot of space
- Record updates & keep current version
 - fast updates & queries to current version, space efficient, slow queries in the past
- Path copying
 - applies to trees, no query overhead, space overhead = depth of update
- Fat node
 - partial persistence: $O(1)$ updates and space optimal, $\log \log n$ query overhead
 - full persistence: $O(\log \log n)$ expected amortized updates and space optimal, $\log \log n$ query overhead
- Node copying/splitting
 - fast updates & queries (amortized updates for full persistence)
 - only works for pointer-based structures with $O(1)$ degree
