

# Study café hours

	Monday	Tuesday	Wednesday	Thursday	Friday
8:15-9:00					Lecture
9:15-10:00		Hold 3			
10:15-11:00	Hold 2				
11:15-12:00			Study café		
12:15-13:00					
13:15-14:00	Hold 1				
14:15-15:00			Lecture		
15:15-16:00				Hold 4	
16:15-17:00					

# Lists

- List syntax
- List operations
- copy.deepcopy
- range
- while-else
- for
- for-break-continue-else

# List operations

- List syntax `[value1, value2, ..., valuek]`
- List indexing `L[index], L[-index]`
- List **slices** `L[from:to], L[from:to:step]` or `L[slice(from, to, step)]`
- Creating a copy of a list `L[:]` or `L.copy()`
- List concatenation (creates new list) `X + Y`
- List repetition (repeated concatenation with itself) `42 * L`
- Length of list `len(L)`
- Check if element is in list `e in L`
- Index of first occurrence of element in list `L.index(e)`
- Number of occurrences of element in list `L.count(e)`
- Check if element is not in list `e not in L`
- `sum(L)`   `min(L)`   `max(L)`

# List modifiers (lists are mutable)

- Extend list with elements ( $X$  is modified)  $X.extend(Y)$
- Append an element to a list ( $L$  is modified)  $L.append(42)$
- Replace sublist by another list (length can differ)  $X[i:j] = Y$
- Delete elements from list  $del L[i:j:k]$
- Remove & return element at position  $L.pop(i)$
- Remove first occurrence of element  $L.remove(e)$
- Reverse lists  $L.reverse()$
- $L *= 42$
- $L.insert(i, x)$  same as  $L[i:i]=x$

## Python shell

```
> x = [1, 2, 3, 4, 5]
> x[2:4] = [10, 11, 12]
> x
| [1, 2, 10, 11, 12, 5]
> x = [1, 2, 11, 5, 8]
> x[1:4:2] = ['a', 'b']
| [1, 'a', 11, 'b', 8]
```

# Questions – What is `x` ?

```
x = [1, 2, 3, 4, 5, 6, 7, 8, 9, 10]  
x[2:8:3] = ['a', 'b']
```

- a) [1, 2, 'a', 'b', 5, 6, 7, 8, 9, 10]
- b) [1, 'a', 3, 4, 5, 6, 7, 'b', 9, 10]
- c) [1, 2, 3, 4, 5, 6, 7, 'a', 'b']
-  d) [1, 2, 'a', 4, 5, 'b', 7, 8, 9, 10]
- e) ValueError
- f) Don't know

# Questions – What is `y` ?

```
y = [1,2,3,4,5,6,7,8,9,10,11,12,13,14,15,16,17,18,19]  
y = y[3:15:3][1:4:2]
```

- a) [3, 6, 9, 12, 15]
-  b) [7, 13]
- c) [1, 9]
- d) [4, 7, 10, 13, 2, 4 ]
- e) TypeError
- f) Don't know

# Nested lists (multi-dimensional lists)

- Lists can contain lists as elements, that can contain lists as elements, that ...
- Can e.g. be used to store multi-dimensional data (list lengths can be non-uniform)

Note: For dealing with matrices the numpy module is a better choice

## multidimensional-lists.py

```
list1d = [1, 3, 5, 2]
list2d = [[1, 2, 3, 4],
           [5, 6, 7, 9],
           [0, 8, 2, 3]]
list3d = [[[5,6], [4,2], [1,7], [2,4]],
           [[1,2], [6,3], [2,5], [7,5]],
           [[3,8], [1,5], [4,3], [2,4]]]
```

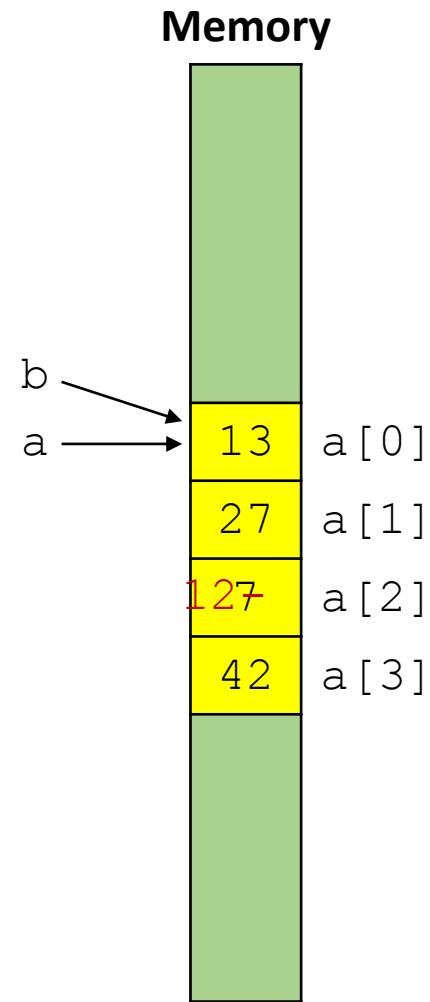

```
print(list1d[2])
print(list2d[1][2])
print(list3d[2][0][1])
```

## Python shell

```
| 5
| 7
| 8
```

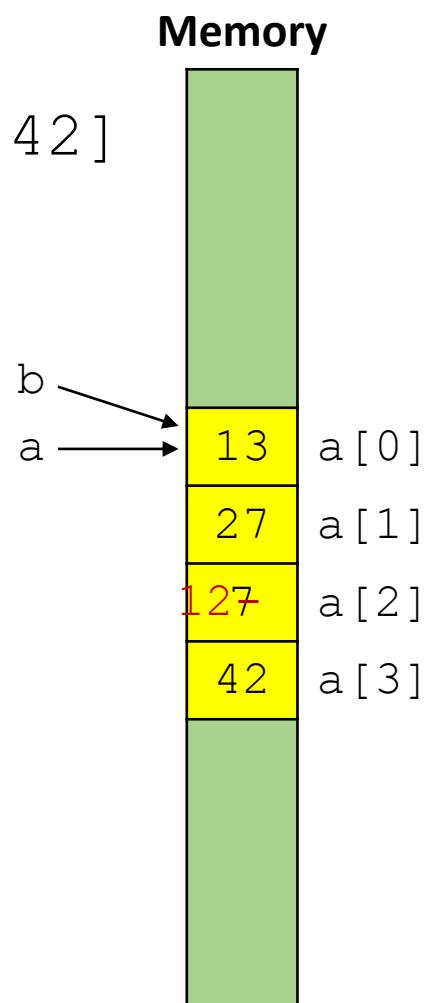

# aliasing

```
a = [13, 27, 7, 42]  
b = a  
a[2] = 12
```

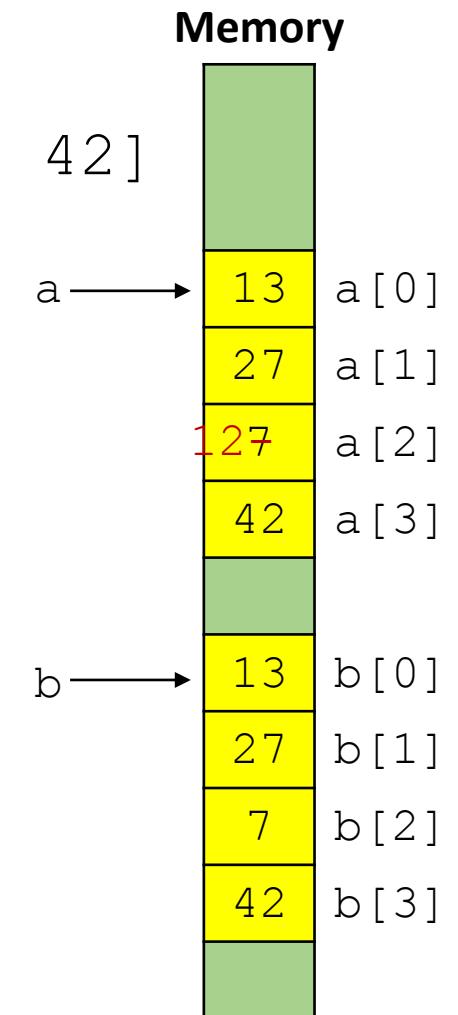

$y = x$       VS       $y = x[:]$

$a = [13, 27, 7, 42]$   
 $b = a$   
 $a[2] = 12$

$a = [13, 27, 7, 42]$   
 $b = a[:]$   
 $a[2] = 12$

# `x [ : ]` vs nested structures

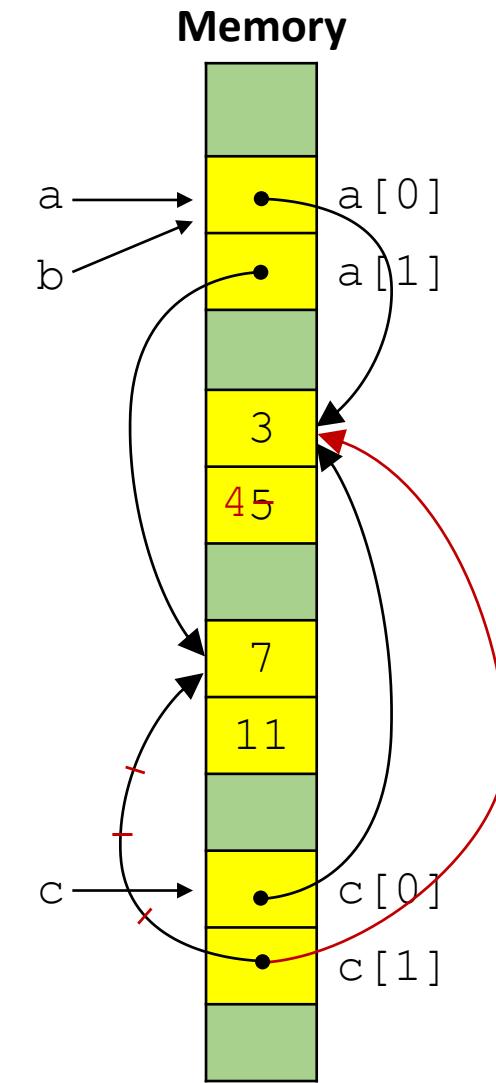

```
a = [[3, 5], [7, 11]]
```

```
b = a
```

```
c = a[ : ]
```

```
a[0][1] = 4
```

```
c[1] = b[0]
```

# Question – what is c ?

a)  $\begin{bmatrix} [3, 5], [7, 11] \end{bmatrix}$

b)  $\begin{bmatrix} [3, 5], [3, 5] \end{bmatrix}$

c)  $\begin{bmatrix} [3, 4], [3, 5] \end{bmatrix}$

😊 d)  $\begin{bmatrix} [3, 4], [3, 4] \end{bmatrix}$

e) Don't know

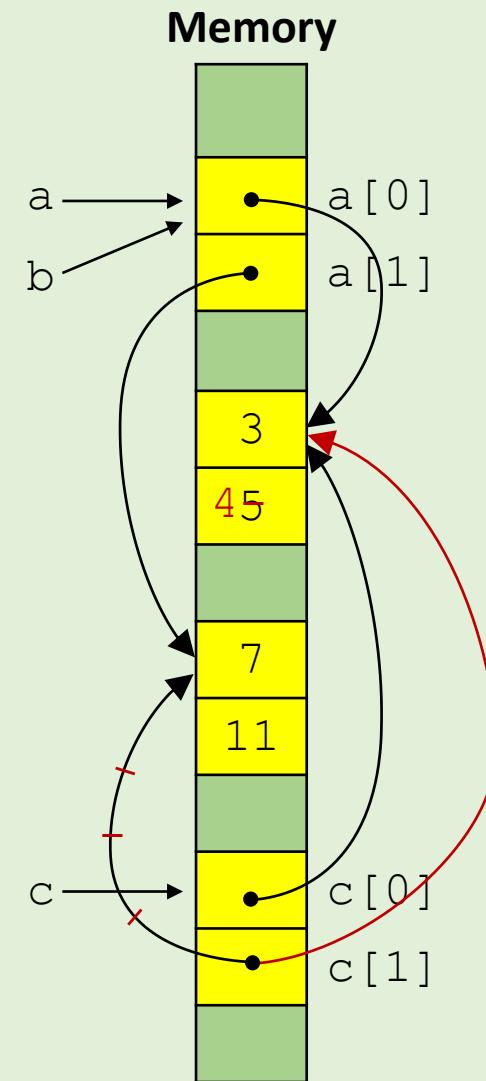

$a = \begin{bmatrix} [3, 5], [7, 11] \end{bmatrix}$

$b = a$

$c = a[::]$

$a[0][1] = 4$

$c[1] = b[0]$

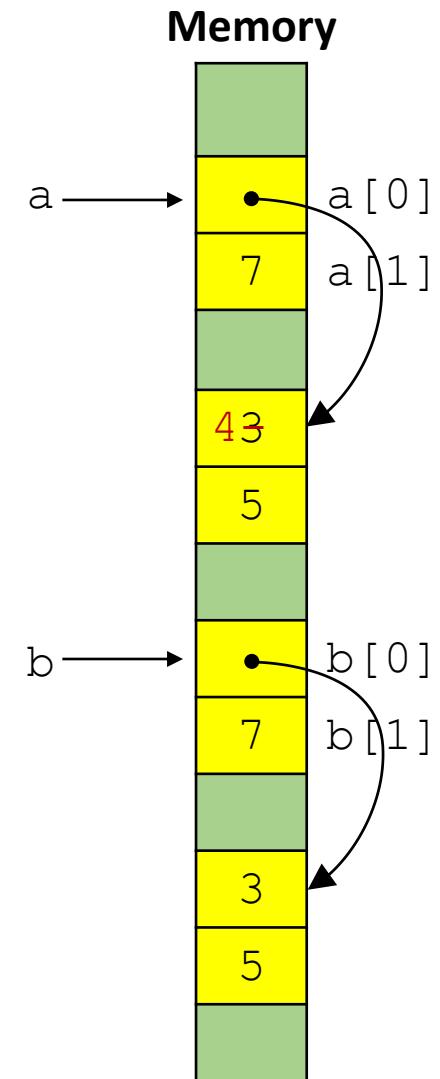

# copy.deepcopy

- To make a copy of all parts of a composite value use the function **deepcopy** from module `copy`

## Python shell

```
> from copy import deepcopy
> a = [[3, 5], 7]
> b = deepcopy(a)
> a[0][0] = 4
> a
| [[4,5],7]
> b
| [[3,5],7]
```

# Initializing a 2-dimensional list

## Python shell

```
> x = [1] * 3
> x
[1, 1, 1]
> y = [[1] * 3] * 4
> y
[[1, 1, 1], [1, 1, 1], [1, 1, 1], [1, 1, 1]]
> y[0][0] = 0
> y
[[0, 1, 1], [0, 1, 1], [0, 1, 1], [0, 1, 1]]
```

## Python shell

```
> y = []
> for _ in range(4): y.append([1] * 3)
> y[0][0] = 0
> y
[[0, 1, 1], [1, 1, 1], [1, 1, 1], [1, 1, 1]]
```

# range(*from*, *to*, *step*)

- `range (from, to, else)` generates a **sequence** of numbers smaller than *to* starting with *from*, and with increments of *step*:

<code>range (5)</code>	<code>: 0, 1, 2, 3, 4</code>
<code>range (3, 8)</code>	<code>: 3, 4, 5, 6, 7</code>
<code>range (2, 11, 3)</code>	<code>: 2, 5, 8</code>

- Ranges are immutable, can be indexed like a list, sliced, and compared (i.e. generate the same numbers)
- `list(range(...))` generates the explicit list of numbers

## Python shell

```
> range(1, 10000000, 3)[2]
| 7
> range(1, 10000000, 3)[100:120:4]
| range(301, 361, 12)
> range(1, 10000000, 3)[100:120:4][2:3]
| range(325, 337, 12)
> list(range(5, 14, 3))
| [5, 8, 11]
```

Question – What is `range(3, 20, 4)[2:4][1]` ?

- a) 3
- b) 7
- c) 11
-  d) 15
- e) 19
- f) Don't know

# for - loop

- For every element in a **sequence** execute a block of code:

```
for var in sequence:  
    block
```

- Sequences can e.g. be lists, strings, ranges
- `break` and `continue` can be used like in a while-loop to break out of the for-loop or continue with the next element in the sequence

## Python shell

```
> for x in [1, "abc", [2, 3], 5.0]:  
>     print(x)  
1  
abc  
[2, 3]  
5.0  
> for x in "abc":  
>     print(x)  
a  
b  
c  
> for x in range(5, 15, 3):  
>     print(x)  
5  
8  
11  
14
```

# Question – What is printed ?

Python shell

```
> for i in range(1, 4):
>     for j in range(i, 4):
>         print(i, j, sep=':', end=' ')
```

- a) 1:1 1:2 1:3 2:1 2:2 2:3 3:1 3:2 3:3
-  b) 1:1 1:2 1:3 2:2 2:3 3:3
- c) 1:1 2:1 3:1 1:2 2:2 3:2 1:3 2:3 3:3
- d) 1:1 2:1 3:1 2:2 3:2 3:3
- e) Don't know

```

# Palindromic substrings

- Find all **palindromic** substrings of length  $\geq 2$ , that are spelled identically forward and backwards:

abraca**d**rabra**t**ra**ll**alla  
  i   j            i    j

- Algorithm:** Test all possible substrings (brute force/exhaustive search)
- Note:** the slice `t [ ::-1 ]` is `t` reversed

## palindrom.py

```
s = "abracadabrabratrallalla"

for i in range(len(s)):
    for j in range(i + 2, len(s) + 1):
        t = s[i:j]
        if t == t[::-1]:
            print(t)
```

## Python shell

```
aca
alla
allalla
ll
llall
lal
alla
ll
```

# Sieve of Eratosthenes

- Find all prime numbers  $\leq n$
- Algorithm:

2 3 4 5 6 7 8 9 10 11 12 13 14 ...  
2 3 4 5 6 7 8 9 10 11 12 13 14 ...  
2 3 4 5 6 7 8 9 10 11 12 13 14 ...  
2 3 4 5 6 7 8 9 10 11 12 13 14 ...  
2 3 4 5 6 7 8 9 10 11 12 13 14 ...  
2 3 4 5 6 7 8 9 10 11 12 13 14 ...

## eratosthenes.py

```
n = 100
prime = [True] * (n + 1)

for i in range(2, n):
    for j in range(2 * i, n + 1, i):
        prime[j] = False

for i in range(2, n+1):
    if prime[i]:
        print(i, end=' ')
```

## Python shell

```
| 2 3 5 7 11 13 17 19 23 29 31 37 41
| 43 47 53 59 61 67 71 73 79 83 89
| 97
```

# while-else and for-else loops

- Both for- and while-loops can have an optional “else”:

```
for var in sequence:  
    block  
else:  
    block
```

```
while condition:  
    block  
else:  
    block
```

- The “else” block is only executed if no `break` is performed in the loop
- The “else” construction for loops is specific to Python, and does not exist in e.g. C, C++ and Java

# Linear search

linear-search-while.py

```
L = [7, 3, 6, 4, 12, 'a', 8, 13]
x = 4

i = 0
while i < len(L):
    if L[i] == x:
        print(x, "at position", i, "in", L)
        break
    i = i + 1

if i >= len(L):
    print(x, "not in", L)
```

linear-search-while-else.py

```
i = 0
while i < len(L):
    if L[i] == x:
        print(x, "at position", i, "in", L)
        break
    i = i + 1
else:
    print(x, "not in", L)
```

linear-search-for.py

```
found = False
for i in range(len(L)):
    if L[i] == x:
        print(x, "at position", i, "in", L)
        found = True
        break

if not found:
    print(x, "not in", L)
```

linear-search-for-else.py

```
for i in range(len(L)):
    if L[i] == x:
        print(x, "at position", i, "in", L)
        break
else:
    print(x, "not in", L)
```

linear-search-builtin.py

```
if x in L:
    print(x, "at position", L.index(x), "in", L)
else:
    print(x, "not in", L)
```
