

Multi-dimensional data

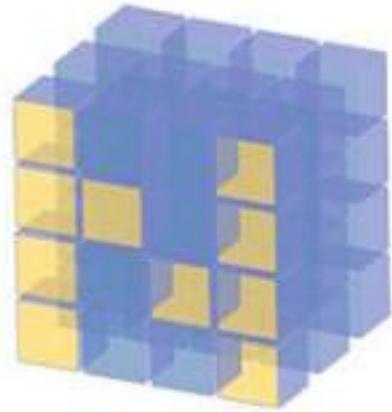

- NumPy
- matrix multiplication, @
- `numpy.linalg.solve`, `numpy.polyfit`

Array programming with NumPy

Harris et al.

Nature, volume 585, pages 357–362, 2020

DOI [10.1038/s41586-020-2649-2](https://doi.org/10.1038/s41586-020-2649-2)

NumPy

- NumPy is a Python package for dealing with multi-dimensional data

www.numpy.org

docs.scipy.org/doc/numpy/user/quickstart.html

pylab ?

- Guttag uses pylab in the examples, but...

“pylab is a convenience module that bulk imports matplotlib.pyplot (for plotting) and numpy (for mathematics and working with arrays) in a single name space. Although many examples use pylab, it is no longer recommended.”

NumPy arrays (example)

Python shell

```
> range(0, 1, .3)
| TypeError: 'float' object cannot be
| interpreted as an integer
> [1 + i / 4 for i in range(5)]
| [1.0, 1.25, 1.5, 1.75, 2.0]
```

} python only supports ranges of int
} generate 5 uniform values in range [1,2]

Python shell

```
> import numpy as np
> np.arange(0, 1, 0.3)
| array([0. , 0.3, 0.6, 0.9])
> type(np.arange(0, 1, 0.3))
| <class 'numpy.ndarray'>
> help(numpy.ndarray)
| +2000 lines of text
> np.linspace(1, 2, 5)
| array([1. , 1.25, 1.5 , 1.75, 2. ])
```

} numpy can generate ranges with float
} returns a "NumPy array" (not a list)
"arange" ≡ "array range" and generates the array explicitly
} generate n uniformly spaced values

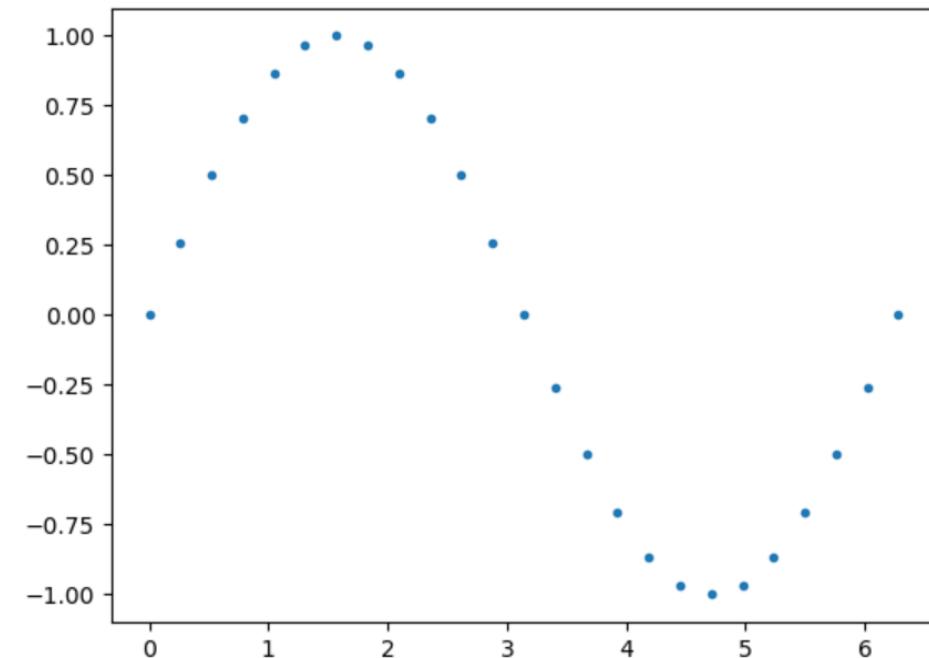

Plotting a function (example)

sin.py

```
import matplotlib.pyplot as plt
import math
n = 25
x = [2*math.pi * i / (n-1) for i in range(n)]
y = [math.sin(v) for v in x]
plt.plot(x, y, '.')
plt.show()
```

sin_numpy.py

```
import matplotlib.pyplot as plt
import numpy as np
x = np.linspace(0, 2 * np.pi, 25)
y = np.sin(x)
plt.plot(x, y, '.')
plt.show()
```

- `np.sin` applies the sin function *to each element of x*
- pyplot accepts NumPy arrays
- $\text{math.pi} == \text{np.pi} \approx \frac{22}{7}$

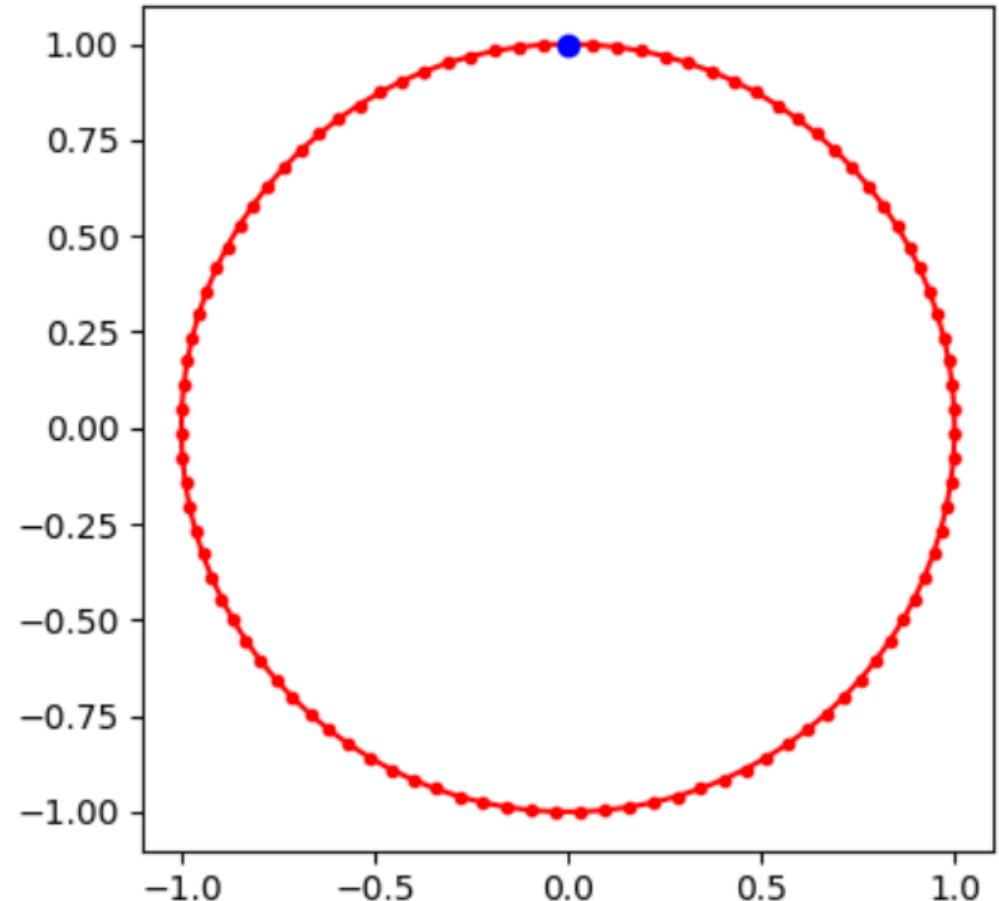

A circle

circle.py

```
import matplotlib.pyplot as plt
import numpy as np

a = np.linspace(0, 2 * np.pi, 100)
x = np.sin(a)
y = np.cos(a)

plt.plot(x, y, 'r.-')
plt.plot(x[0], y[0], 'bo')
plt.show()
```

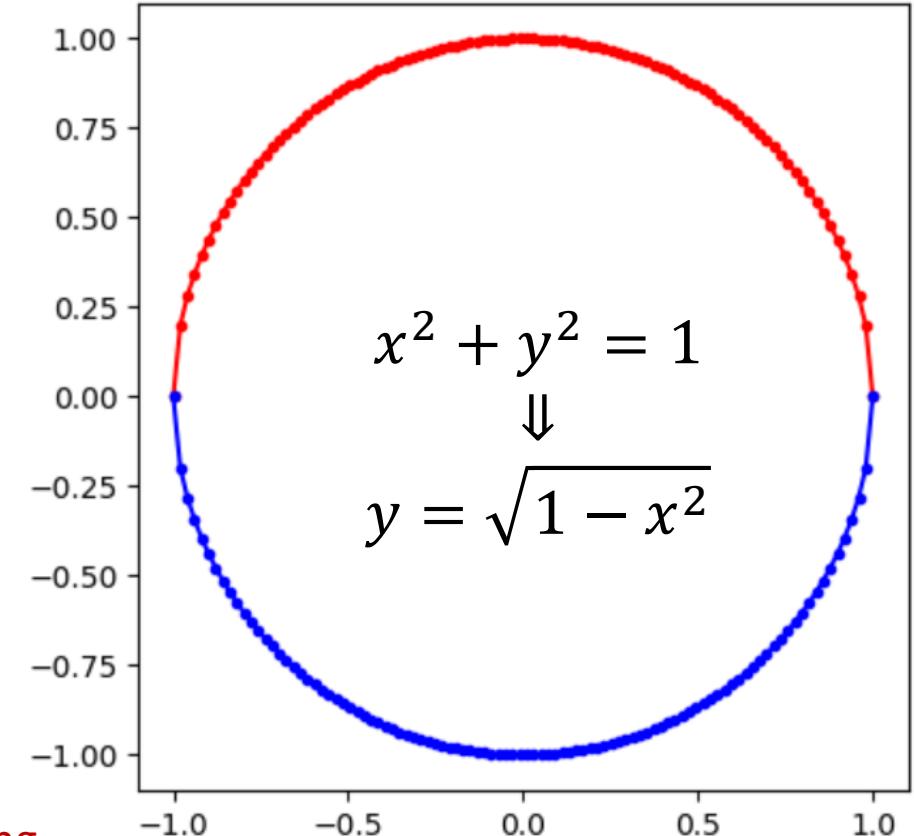

Two half circles

half_circles.py

```
import matplotlib.pyplot as plt
import numpy as np

x = np.linspace(-1, 1, 100)
plt.plot(x, np.sqrt(1 - x**2), 'r.-')
plt.plot(x, -np.sqrt(1 - x**2), 'b.-')
plt.show()
```

- `x` is a NumPy array
- `**` NumPy method `__pow__` squaring each element in `x`
- `binary -` NumPy method `__rsub__` that for each element `e` in `x` computes `1 - e`
- `np.sqrt` NumPy method computing the square root of each element in `x`
- `unary -` NumPy method `__neg__` that negates each element in `x`

Creating one-dimensional NumPy arrays

Python shell

```
> np.array([1, 2, 3])  
| array([1, 2, 3])  
> np.array((1, 2, 3))  
| array([1, 2, 3])  
> np.array(range(1, 4))  
| array([1, 2, 3])  
> np.arange(1., 4., 1.)  
| array([1., 2., 3.])  
> np.linspace(1, 3, 3)  
| array([1., 2., 3.])  
> np.zeros(3)  
| array([0., 0., 0.])  
> np.ones(3)  
| array([1., 1., 1.])  
> np.full(3, 7)  
| array([7, 7, 7])  
> np.random.random(3)  
| array([0.73761651,  
       0.60607355, 0.3614118 ])
```

```
> np.array([1, 2, 3]).dtype      # type of all values  
| dtype('int32')  
> np.arange(3, dtype='float')  
| array([0., 1., 2.])  
> np.arange(3, dtype='int16')    # 16 bit integers  
| array([0, 1, 2], dtype=int16)  
> np.arange(3, dtype='int32')    # 32 bit integers  
| array([0, 1, 2])  
> 1000 ** np.arange(5)  
| array([1, 1000, 1000000, 1000000000,  
       -727379968], dtype=int32)  # OOPS.. overflow !  
> 1000 ** np.arange(5, dtype='O')  
| array([1, 1000, 1000000, 1000000000,  
       100000000000], dtype=object) # Python integer  
> np.arange(3, dtype='complex')  
| array([0.+0.j, 1.+0.j, 2.+0.j])
```

 Elements of a NumPy array are not arbitrary precision integers by default – you can select between +25 number representations

Mantissa size in various numpy floats

Python shell

```
> for data_type in ['half', 'float', 'single', 'double', 'longdouble', 'float32', 'float64']:
    x = np.array([1], dtype=data_type)
    for i in range(100):
        if x == x + (x / 2) ** i:  
            break
        print(data_type, i - 1, 'bits mantissa')
half 10 bits mantissa
float 52 bits mantissa
single 23 bits mantissa
double 52 bits mantissa
longdouble 52 bits mantissa
float32 23 bits mantissa          # platform independent
float64 52 bits mantissa          # platform independent
```

mantissa
 $1.\underbrace{00001}_{i}0000_2$

Creating multi-dimensional NumPy arrays

Python shell

```
> np.array([[1, 2, 3], [4, 5, 6]])
| array([[1, 2, 3],
|        [4, 5, 6]])
> np.arange(1, 7).reshape(2, 3)
| array([[1, 2, 3],
|        [4, 5, 6]])
> x = np.arange(12).reshape(2, 2, 3)
> x
| array([[[ 0,  1,  2],
|          [ 3,  4,  5]],
|         [[ 6,  7,  8],
|          [ 9, 10, 11]]])
> numpy.zeros((2, 5), dtype='int32')
| array([[0, 0, 0, 0, 0],
|        [0, 0, 0, 0, 0]])
> x.size
| 12
> x.ndim
| 3
> x.shape
| (2, 2, 3)
> x.dtype
| dtype('int32')
> x.flatten()
| array([0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11])
> list(x.flat) # flat is an iterator
| [0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11]
> np.eye(3)      # diagonal 2D array
| array([[1., 0., 0.],
|        [0., 1., 0.],
|        [0., 0., 1.]])
```

View vs Copy

- Numpy is optimized to handle big multi-dimensional arrays
- To *avoid copying data*, **views** allows one to look at the underlying data in different ways (data can be shared by multiple views)
- `reshape`, `ravel` and `slicing` are examples creating views
- `flatten` and `ravel` both turn multiple dimensional arrays into one dimensional arrays but `flatten` creates an explicit copy whereas `ravel` creates a space efficient view

Python shell

```
> x = np.arange(6)
> y = x.reshape(2, 3)      # view
> y[0][0] = 42             # updates x
> x
| array([42, 1, 2, 3, 4, 5])
> y
| array([[42, 1, 2],
|        [3, 4, 5]])
> z = y.flatten()          # copy
> z[5] = 0
> z
| array([42, 1, 2, 3, 4, 0])
> x
| array([42, 1, 2, 3, 4, 5])
> w = y.ravel()            # view
> w[5] = -1
> w
| array([42, 1, 2, 3, 4, -1])
> x
| array([42, 1, 2, 3, 4, -1])
```

NumPy operations

Python shell

```
> x = numpy.arange(3)
> x
| array([0, 1, 2])
> x + x # elementwise addition
| array([0, 2, 4])
> 1 + x # add integer to each element
| array([1, 2, 3])
> x * x # elementwise multiplication
| array([0, 1, 4])
> np.dot(x, x) # dot product
| 5
> np.cross([1, 2, 3], [3, 2, 1]) # cross product
| array([-4, 8, -4])
```

```
> a = np.arange(6).reshape(2,3)
> a
| array([[0, 1, 2],
|        [3, 4, 5]])
> a.T # matrix transposition, view
| array([[0, 3],
|        [1, 4],
|        [2, 5]])
> a @ a.T # matrix multiplication
| array([[ 5, 14],
|        [14, 50]])
> a += 1
> a
| array([[1, 2, 3],
|        [4, 5, 6]])
```

Universal functions (apply to each entry)

Python shell

```
> x = np.array([[1, 2], [3, 4]])
> np.sin(x) # also: cos, exp, sqrt, log, ceil, floor, abs
| array([[ 0.84147098,  0.90929743],
|        [ 0.14112001, -0.7568025 ]])
> np.sign(np.sin(x))
| array([[ 1.,  1.],
|        [ 1., -1.]])
> np.mod(np.arange(10), 3) # same as: np.arange(10) % 3
| array([0, 1, 2, 0, 1, 2, 0, 1, 2, 0], dtype=int32)
```

Axis

Python shell

```
> x = np.arange(1, 7).reshape(2, 3)
> x
| array([[1, 2, 3],
|        [4, 5, 6]])
> x.sum() # = x.sum(axis=(0, 1))
| 21
> x.sum(axis=0)
| array([5, 7, 9])
> x.sum(axis=1)
| array([6, 15])
> x.min() # = x.min(axis=(0, 1))
| 1
```

Python shell

```
> x.min(axis=0)
| array([1, 2, 3])
> x.min(axis=1)
| array([1, 4])
> x.cumsum()
| array([ 1,  3,  6, 10, 15, 21], dtype=int32)
> x.cumsum(axis=0)
| array([[1, 2, 3],
|        [5, 7, 9]], dtype=int32)
> x.cumsum(axis=1)
| array([[ 1,  3,  6],
|        [ 4,  9, 15]], dtype=int32)
```

Slicing

Python shell

```
> x = numpy.arange(20).reshape(4,5)
> x
| array([[ 0,  1,  2,  3,  4],
|        [ 5,  6,  7,  8,  9],
|        [10, 11, 12, 13, 14],
|        [15, 16, 17, 18, 19]])
> x[2, 3] # = x[(2, 3)]
| 13
> x[1:4:2, 2:4:1] # rows 1 and 3, and columns 2 and 3, view
| array([[ 7,  8],
|        [17, 18]])
> x[:,3]
| array([ 3,  8, 13, 18])
> x[...,3] # ... is placeholder for ':' for all missing dimensions
| array([ 3,  8, 13, 18])
> type(...)
| <class 'ellipsis'>
```

Broadcasting (stretching arrays to get same size)

- Numpy tries to apply *broadcasting*, if array shapes do not match, i.e. adds missing leading dimensions and repeats a dimension with only one element:

```
[[1], [2]] + [10,20]    column + row vector  
≡ [[1], [2]] + [[10,20]]    both ndim = 2  
≡ [[1,1], [2,2]] + [[10,20]]  
≡ [[1,1], [2,2]] + [[10,20], [10,20]]  
≡ [[11,21], [12,22]]
```

- To prevent unexpected broadcasting, add an assertion to your program:

```
assert x.shape == y.shape
```

Python shell

```
> x = np.array([[1, 2, 3], [4, 5, 6]])  
> y = np.array([1, 2, 3]) # one row  
> z = np.array([[1], [2]]) # one column  
> x + 3 # add 3 to each entry  
| array([[4, 5, 6],  
|        [7, 8, 9]])  
> x + y # add y to each row  
| array([[2, 4, 6],  
|        [5, 7, 9]])  
> x + z # add z to each column  
| array([[2, 3, 4],  
|        [6, 7, 8]])  
> y + z # 2 rows with y + 3 columns with z  
| array([[2, 3, 4],  
|        [3, 4, 5]])  
> z == z.T # [[1,1],[2,2]] == [[1,2],[1,2]]  
| array([[ True, False],  
|        [False,  True]])
```

Masking

Python shell

```
> x = np.arange(1, 11).reshape(2, 5)
> x
| array([[ 1,  2,  3,  4,  5],
|        [ 6,  7,  8,  9, 10]])
> x % 3
| array([[1, 2, 0, 1, 2],
|        [0, 1, 2, 0, 1]], dtype=int32)
> x % 3 == 0
| array([[False, False,  True, False, False],
|        [ True, False, False,  True, False]])
> x[x % 3 == 0] # use Boolean matrix to select entries
| array([3, 6, 9])
> x[:, x.sum(axis=0) % 3 == 0] # columns with sum divisible by 3
| array([[ 2,  5],
|        [ 7, 10]])
```

Numpy is fast... but be aware of dtype

Python shell

```
> sum([x**2 for x in range(1000000)])
| 333332833333500000
> (np.arange(1000000)**2).sum()
| 584144992 # wrong since overflow when default dtype='int32'
> (np.arange(1000000, dtype="int64")**2).sum()
| 333332833333500000 # 64 bit integers do not overflow

> import timeit
> timeit('sum([x**2 for x in range(1000000)])', number=1)
| 0.5614346340007614

> timeit('(np.arange(1000000)**2).sum()', setup='import numpy as np', number=1)
| 0.014362967000124627 # ridiculous fast but also wrong result...
> timeit('(np.arange(1000000, dtype="int64")**2).sum()',
| setup='import numpy as np', number=1)
| 0.048017077999247704 # fast and correct

> np.iinfo(np.int32).min
| -2147483648
> np.iinfo(np.int32).max
| 2147483647
```

numpy.int32 – 32 bit signed two's-complement integers

32 bits $b_{31}b_{30}b_{29}b_{28}\dots b_2b_1b_0$

represent the value

$$-b_{31} \cdot 2^{31} + \sum_{i=0}^{30} b_i \cdot 2^i$$

10000000000000000000000000000000	-2147483648
10000000000000000000000000000001	-2147483647

01111111111111111111111111111111	2147483647

Note: There is one more negative number than positive

Python shell

```
> np.int32(- 2 ** 31)
| -2147483648
> np.int32(- 2 ** 31) + 1
| -2147483647
> np.int32(- 2 ** 31) - 1
| 2147483647
> np.int32(2 ** 31)
| OverflowError: Python int too
| large to convert to C long
> np.int32(2 ** 31 - 1)
| 2147483647
> np.int32(2 ** 31 - 1) + 1
| -2147483648
> abs(np.int32(-2147483647))
| 2147483647
> abs(np.int32(-2147483648))
| -2147483648
```

Linear algebra

Python shell

```
> x = np.arange(1, 5, dtype=float).reshape(2, 2)
> x
array([[1., 2.],
       [3., 4.]])
> x.T # matrix transpose
array([[1., 3.],
       [2., 4.]])
> np.linalg.det(x) # matrix determinant
-2.000000000000004
> np.linalg.inv(x) # matrix inverse
array([[-2. ,  1. ],
       [ 1.5, -0.5]])
> np.linalg.eig(x) # eigenvalues and eigenvectors
(array([-0.37228132,  5.37228132]),
 array([[-0.82456484, -0.41597356], [0.56576746, -0.90937671]]))
> y = np.array([[5.], [7.]])
> np.linalg.solve(x, y) # solve linear matrix equations
array([[-3.], # z1
       [ 4.]]) # z2
```

numpy.matrix

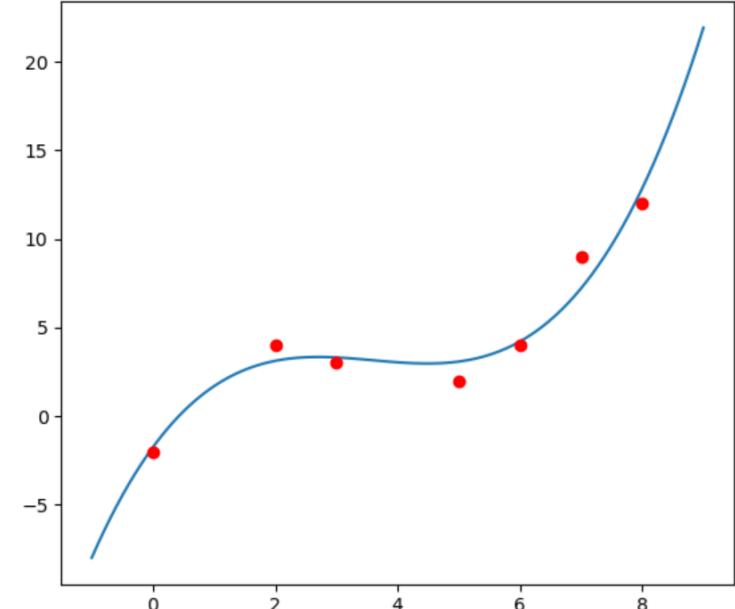

"It is no longer recommended to use this class, even for linear algebra. Instead use regular arrays. The class may be removed in the future."

$$\begin{pmatrix} 1 & 2 \\ 3 & 4 \end{pmatrix} \begin{pmatrix} z_1 \\ z_2 \end{pmatrix} = \begin{pmatrix} 5 \\ 7 \end{pmatrix}$$

numpy.polyfit

- Given n points with $(x_0, y_0), \dots, (x_{n-1}, y_{n-1})$
- Find polynomial p of degree d that minimizes

$$\sum_{i=0}^{n-1} (y_i - p(x_i))^2$$

- known as least squares fit / linear regression / polynomial regression

fit.py

```
import matplotlib.pyplot as plt
import numpy as np

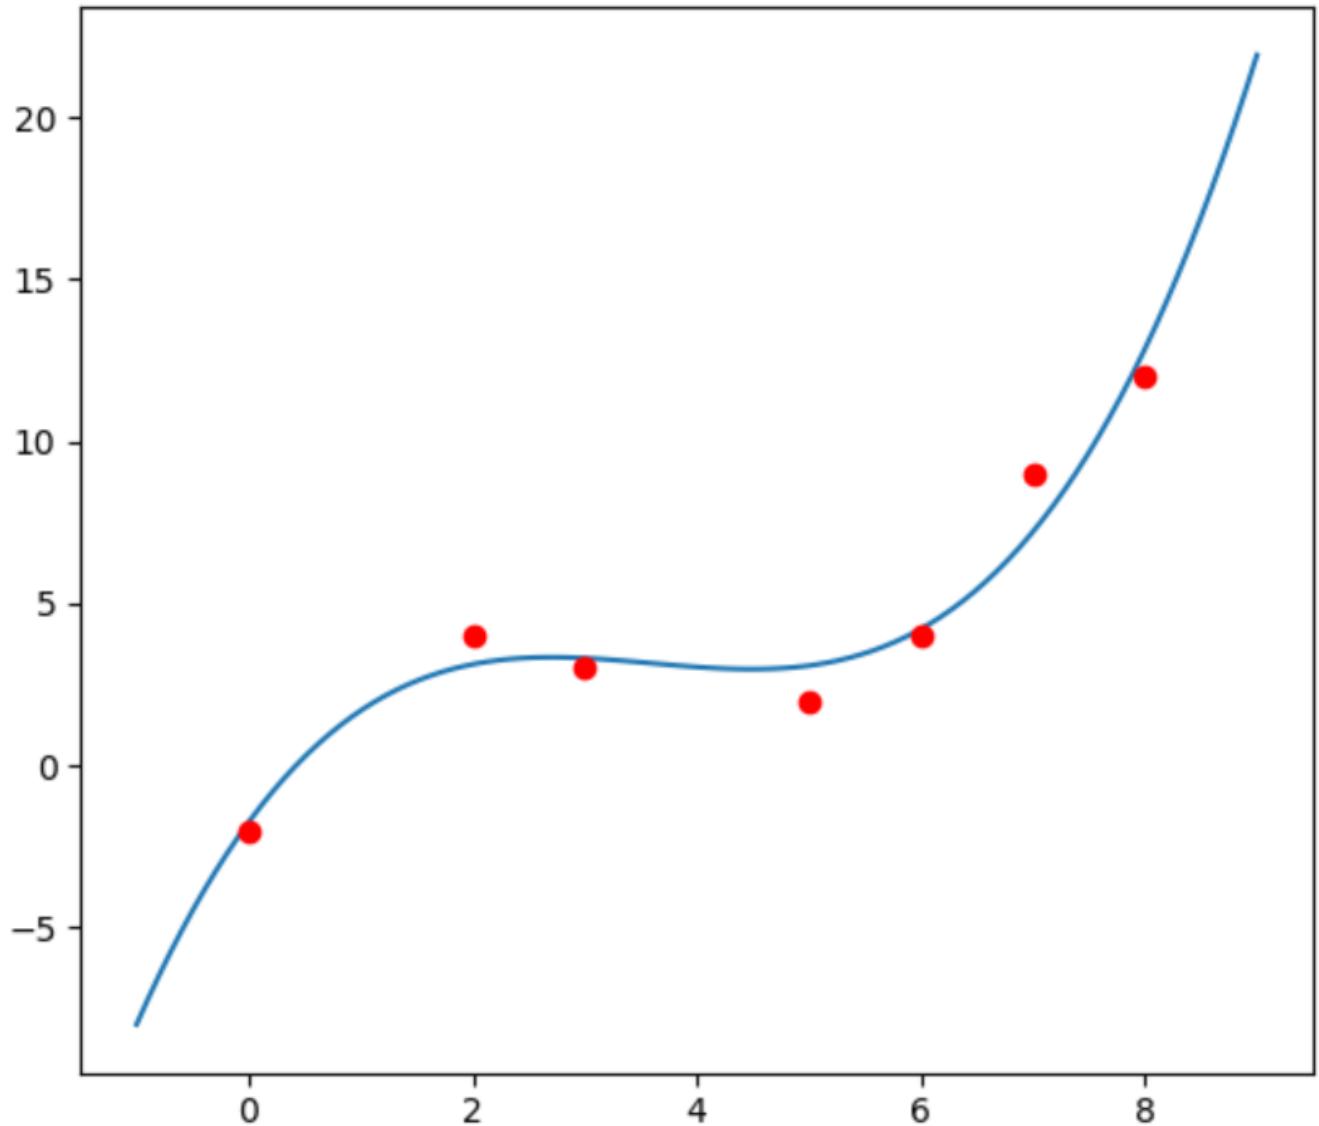

x = [0, 2, 3, 5, 6, 7, 8]
y = [-2, 4, 3, 2, 4, 9, 12]

coefficients = np.polyfit(x, y, 3)      degree
                                         ↓

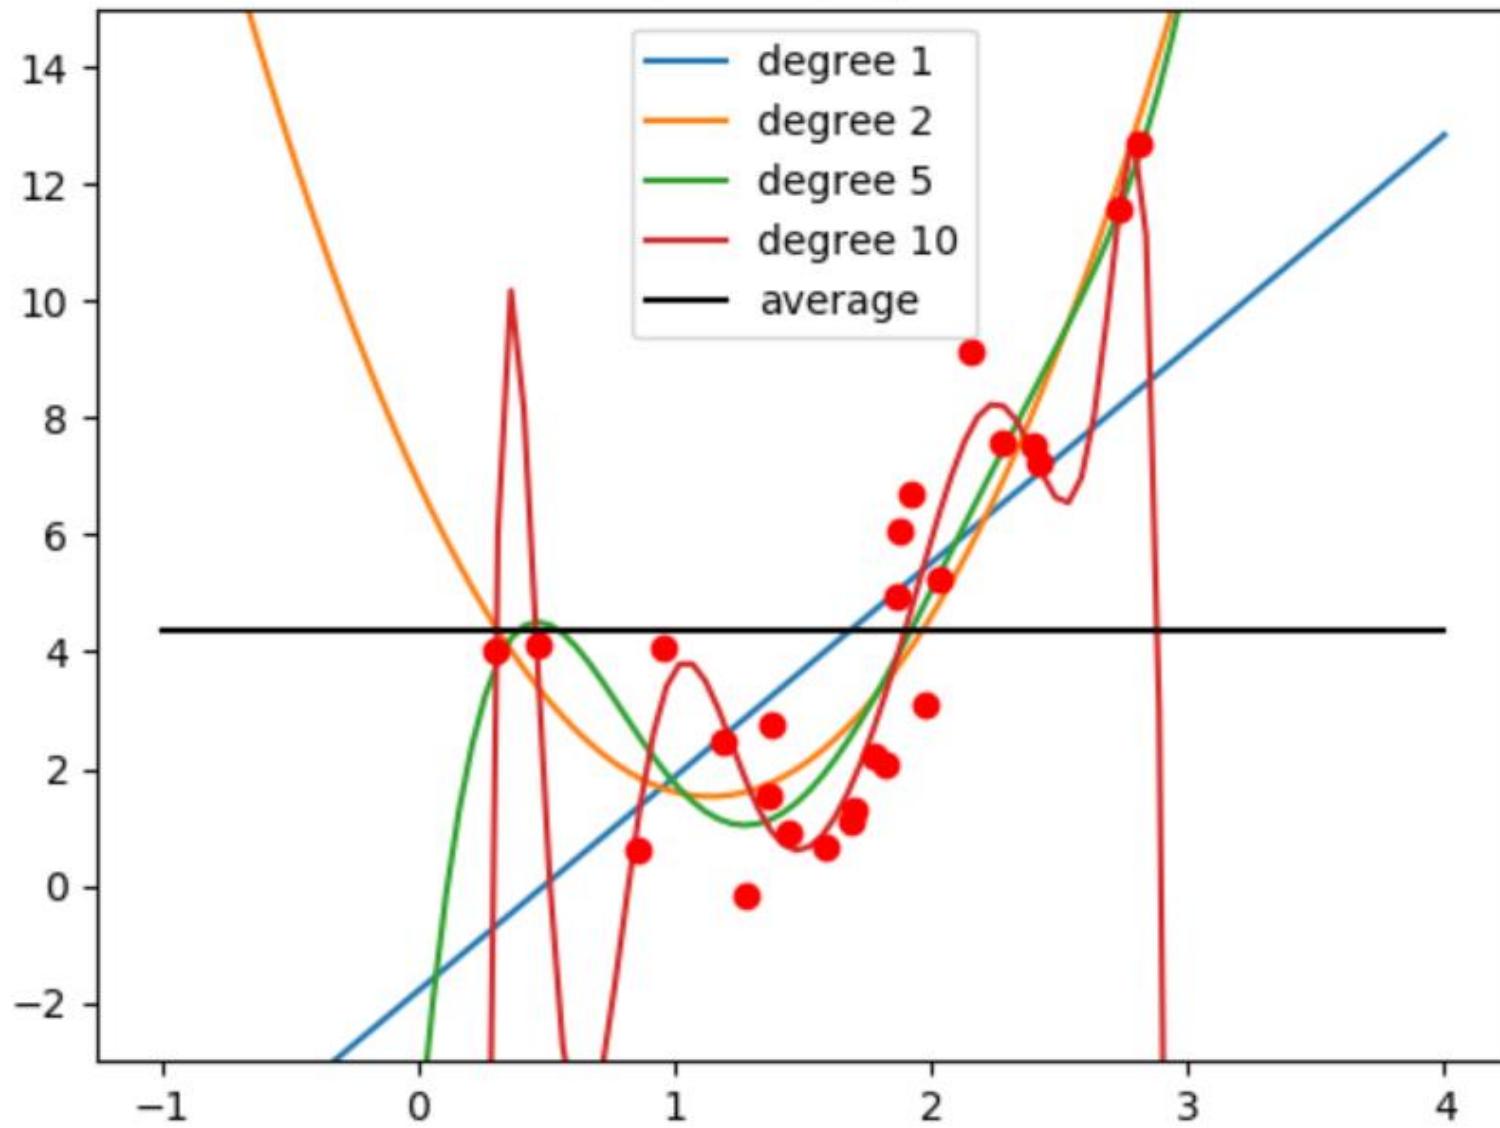

fx = np.linspace(-1, 9, 100)
fy = np.polyval(coefficients, fx)

plt.plot(fx, fy, '-')
plt.plot(x, y, 'ro')

plt.show()
```

Least squares polynomial fit

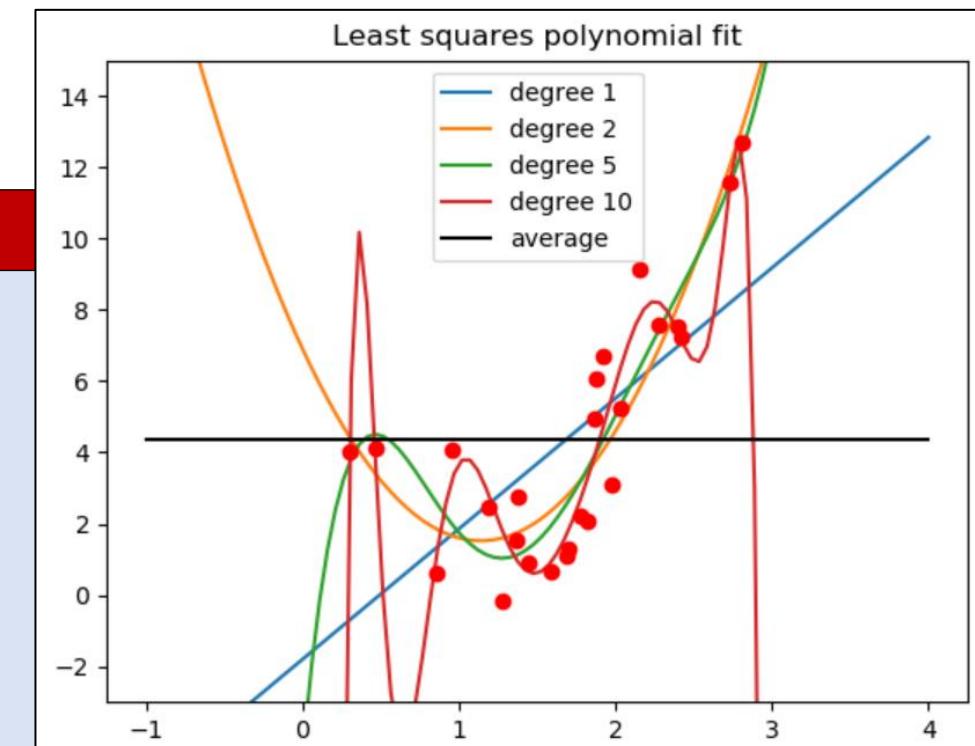

polyfit.py

```
import matplotlib.pyplot as plt
import numpy as np

x = 3 * np.random.random(25)
noise = np.random.random(x.size) ** 2
y = 5 * x ** 2 - 12 * x + 7 + 5 * noise

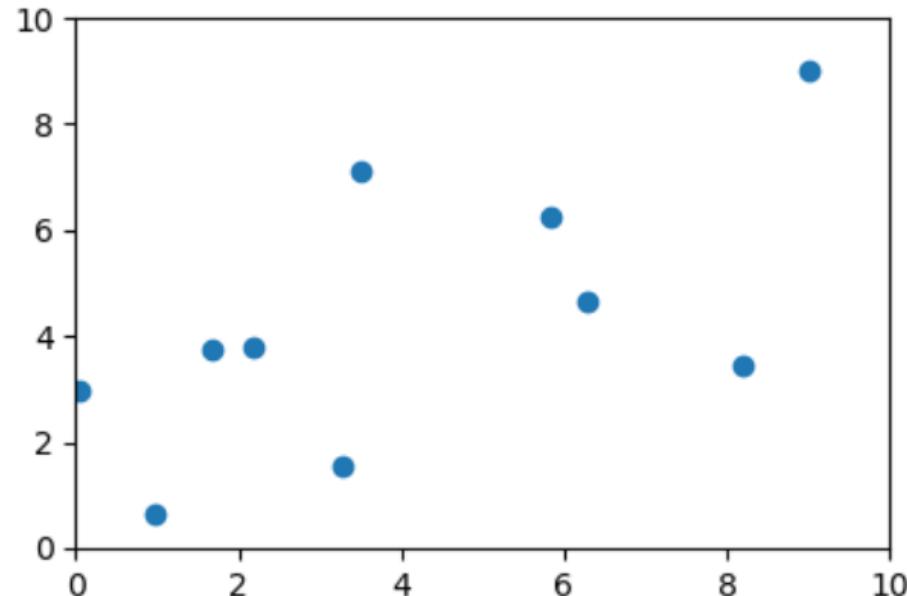

for degree in [1, 2, 5, 10]:
    coefficients = np.polyfit(x, y, degree)
    fx = np.linspace(-1, 4, 100)
    fy = np.polyval(coefficients, fx)
    plt.plot(fx, fy, '-.', label="degree %s" % degree)

avg = np.average(y)
plt.plot(x, y, 'ro')
plt.plot([-1, 4], [avg, avg], 'k-', label="average")
plt.ylim(-3, 15)
plt.title('Least squares polynomial fit')
plt.legend()
plt.show()
```

Animating bouncing balls

- matplotlib figures can be animated using `matplotlib.animation.FuncAnimation` that as arguments takes the figure to be updated/redrawn, a function to call for each update, and an interval in milliseconds between updates

`balls.py`

```
import matplotlib.pyplot as plt
from matplotlib.animation import FuncAnimation
from numpy import zeros, maximum, minimum
from numpy.random import random

g = 0.01
N = 10
x, y = 10.0 * random(N), 1.0 + 9.0 * random(N)
dx, dy = random(N) / 5, zeros(N)

fig = plt.figure()
plt.xlim(0, 10)
plt.ylim(0, 10)
balls, = plt.plot(x, y, 'o') # returns Line2D obj

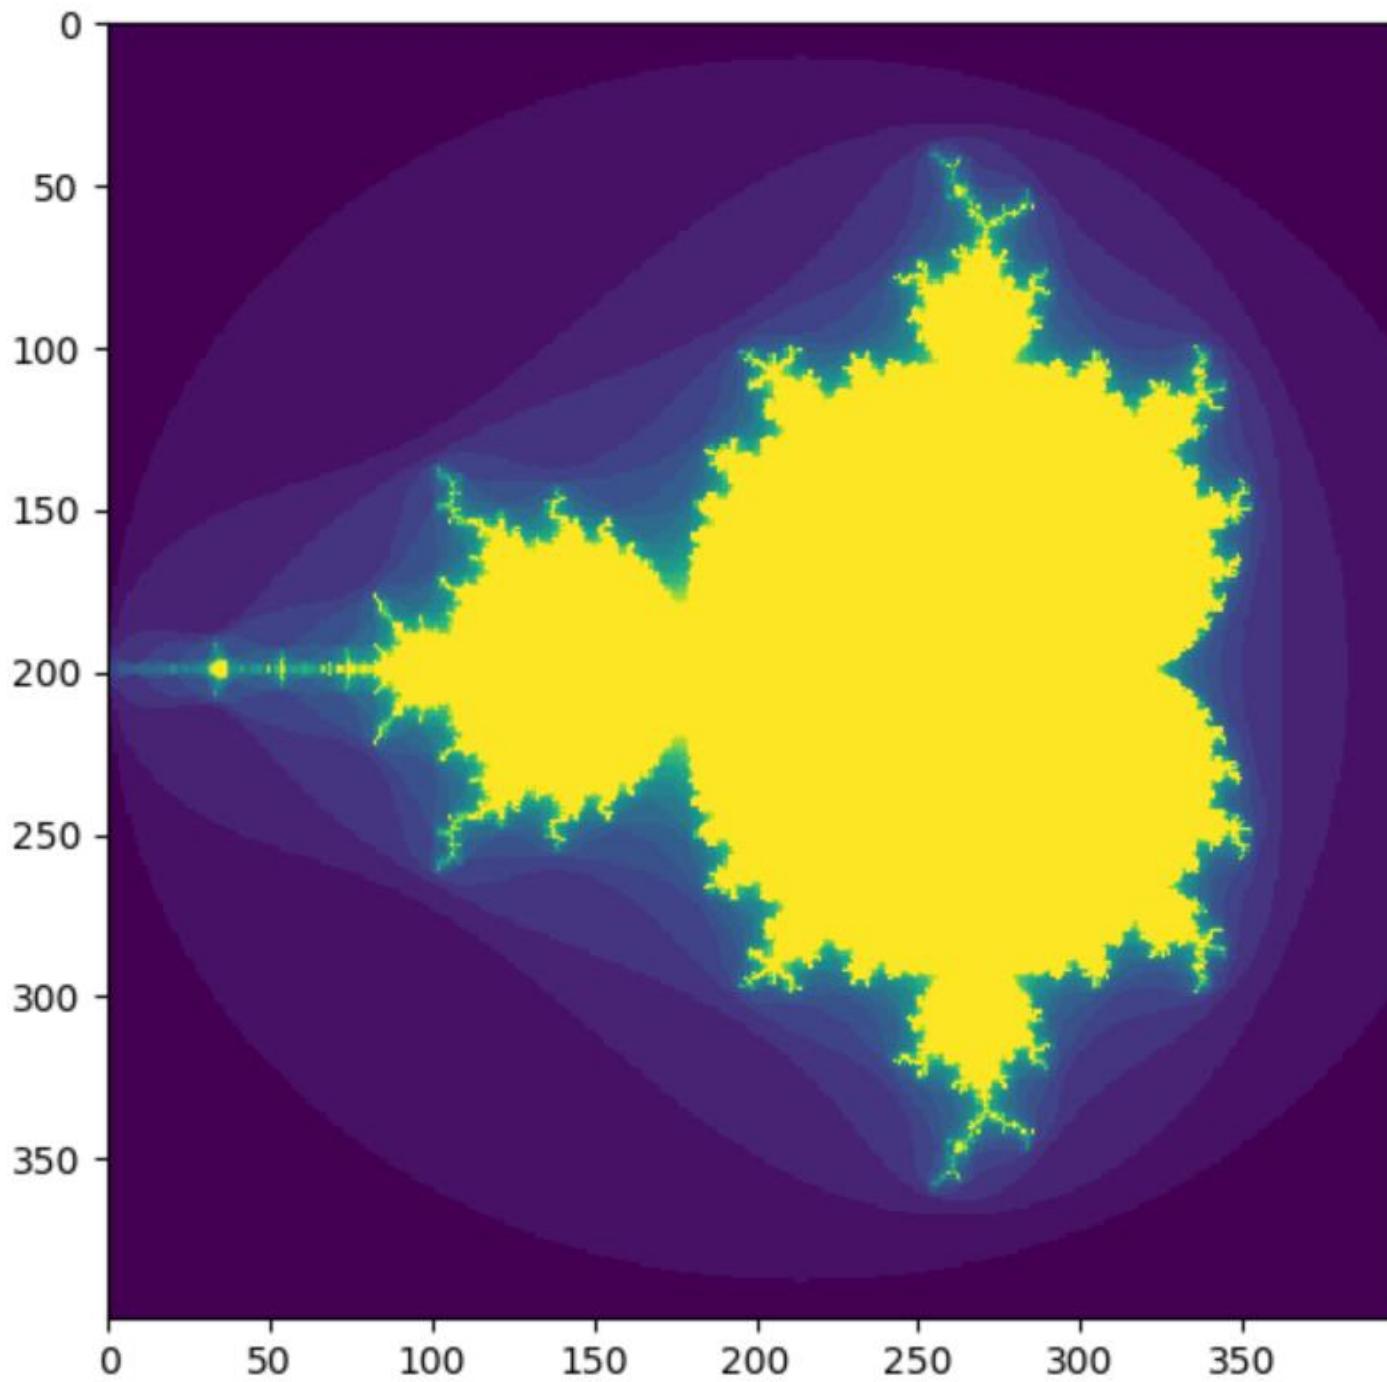

def move(frame):
    global x, y, dx, dy

    x += dx
    bounce = (x > 10.0) | (x < 0.0) # numpy mask
    dx[bounce] = -dx[bounce]
    x = minimum(10.0, maximum(0.0, x))

    y += dy
    bounce = y < 0.0 # numpy mask
    y[bounce] -= dy[bounce]
    dy[bounce] = -dy[bounce]
    dy -= g

    balls.set_data(x, y) # update positions

# removing 'ani =' causes program to fail...
ani = FuncAnimation(fig, move, interval=25)
plt.show()
```

mandelbrot.py

```
import numpy as np
import matplotlib.pyplot as plt

def mandelbrot(h, w, maxit=20):
    """Returns an image of the Mandelbrot fractal of size (h, w)."""

    x = np.linspace(-2.0, 0.8, w).reshape(1, w)      # row vector
    y = np.linspace(-1.4, 1.4, h).reshape(h, 1)        # column vector
    c = x + y * 1j                                     # broadcast & complex
    z = c

    divtime = np.full(z.shape, maxit, dtype=int)        # all values = maxit

    for i in range(maxit):
        z = z * z + c                                  # elementwise
        diverge = z * np.conj(z) > 4                  # who is diverging
        div_now = diverge & (divtime == maxit)          # who is diverging now
